ASSESSMENT 360

AUTOMATED COMPLIANCE VALIDATION

PRODUCT BROCHURE

INTRODUCTION

Manual compliance is overwhelmed by today’s mandates - organizations spend months and thousands of hours each year just gathering evidence, while complex frameworks with numerous technical controls make audits error-prone and inefficient.

KEY PAIN POINTS INCLUDE

- » **Resource Drain**
Manual evidence collection and documentation consume staff time, turning compliance into a continuous time sink. One report found that 80% of compliance time¹ is spent on data entry and chasing records.
- » **Audit Bottlenecks**
Multiple audits per year force teams into permanent audit mode. 92% of organizations² conduct more than one audit annually, stretching limited resources with each cycle and creating bottlenecks in operations.
- » **Surface-Level Assessments**
Traditional audits highlight successes and miss underlying configuration issues. Deep technical validation often reveals widespread control failures that self-assessments never captured.
- » **No Continuous Visibility**
Predominantly manual assessments delay issue detection. Configuration or access-control changes go undiscovered for weeks, undermining compliance and exposing organizations to threats.

TRENDS DRIVING THE PROBLEM

- » **Increasing Regulatory Demands**
Standards like UAE IA are updated often to address new threats, adding requirements and heightening the proof needed for continuous compliance.
- » **Growing Infrastructure Complexity**
Each year adds more platforms and devices - Windows, macOS, Linux - to the compliance scope, forcing teams to track controls across an ever-expanding environment.
- » **Assessment vs. Reality Gap**
Self-reported compliance often exceeds 90%³, but technical audits reveal true rates around 60-70%, highlighting a widening divide between perceived and actual posture.

OUR SOLUTION

ASSESSMENT360 revolutionizes compliance management by automating the most time-consuming and error-prone aspects of regulatory adherence while delivering comprehensive validation across diverse technology infrastructures.

DEVICE INVENTORY MANAGEMENT

ASSESSMENT360 delivers a comprehensive device inventory that ensures every endpoint in your environment is accounted for and categorized. Within hours of deployment, the platform discovers all Windows, Mac, and Linux systems and updates a unified inventory with essential metadata - department, IP address, role, and status.

Dynamic grouping lets you organize devices by business unit or risk profile, ensuring target lists are accurate, current, and aligned with compliance priorities. By centralizing device data, ASSESSMENT360 eliminates the risk of overlooked endpoints and provides a clear foundation for all subsequent compliance activities.

ASSESSMENT RUNS

ASSESSMENT360 provides automated assessment runs that validate compliance against multiple standards - starting with UAE IA and extending to ISO 27001 or any framework you choose. Scheduled or on-demand executions generate detailed compliance results for every device group, highlighting which controls are met, which are lagging, and where remediation is needed.

Summary dashboards surface non-compliant controls and affected endpoints, while risk-based prioritization directs attention to the most critical gaps. Post-run reports deliver a concise compliance score and actionable insights, giving you a clear view of your organization's adherence level.

FEATURES

ASSESSMENT360 delivers end-to-end compliance management through intelligent automation, seamless integration, and continuous monitoring across your entire infrastructure.

- » **Compliance Standards Management**

Enable and configure compliance frameworks on demand using a centralized engine, beginning with UAE IA and extending to any other standards you require. Access a pre-mapped library of technical controls for Windows, macOS, and Linux from a single console. Teams can apply, update, and cross-reference multiple frameworks without switching tools or managing spreadsheets, ensuring consistent control mapping and streamlined standard administration.
- » **Automated Assessment Scheduling**

Schedule one-off scans, weekly checks, or quarterly audits with an intuitive drag-and-drop interface. The agentless, host-based engine remotely probes device configurations, permissions, and patch levels at each interval. All evidence is automatically captured, timestamped, and stored in a secure repository. This approach delivers consistent, repeatable assessments across your environment without installing software on endpoints or manual intervention between runs.
- » **Comprehensive Device Management**

Onboard assets in bulk via CSV import or continuous Active Directory synchronization, automatically ingesting hostnames, departments, IP addresses, and roles. Organize endpoints into custom groups - laptops, servers, or department fleets - using dynamic filters. As devices are added, moved, or retired, inventories are updated in real time. This ensures your device catalog always mirrors the current infrastructure, providing accurate assessment scopes without manual tracking.
- » **Actionable Summary Reporting**

Review assessment results in a highly interactive dashboard that filters by device, group, or compliance standard. Drill into policy drift and control failures, with built-in remediation guidance linked to each issue. The platform tracks remediation progress and automatically updates compliance status as fixes are applied. This transforms raw audit data into clear, prioritized action items, enabling teams to quickly address high-risk gaps and maintain continuous compliance.

BENEFITS

Transform compliance from a resource-intensive burden to a strategic advantage, delivering improvements to cost, speed, and accuracy.

- » **Significant Cost Reduction**

Automate the bulk of manual audit tasks to streamline processes, eliminate repetitive work, and cut operational overhead - freeing budget and personnel for strategic security projects and ongoing compliance program enhancements.
- » **Improved Accuracy**

Replace error-prone manual checks with consistent, automated control validations and continuous configuration monitoring, detecting policy drift and reducing compliance gaps before they escalate.
- » **Substantial Time Savings**

Transform weeks of manual evidence gathering into hours with automated scans and reporting, accelerating audit cycles, ensuring repeatable assessments, and allowing teams to focus on high-value risk analysis.
- » **Actionable Visibility**

Leverage interactive dashboards that highlight compliance gaps and track remediation, turning raw assessment data into prioritized action items for proactive compliance management.

ORYXLABS

WHO WE ARE

ORYXLABS was founded in Abu Dhabi in 2020 with a passion for cybersecurity-focused engineering.

A proudly diverse staff hailing from 22 different countries with backgrounds ranging from national defense to world-renowned top software engineering organizations joined together to develop best-in-class security solutions.

We leverage research and innovation to provide solutions in four key areas:

- » Cyber Security Assessment
- » Monitoring
- » Prevention
- » Improvement

When combined, ORYXLABS solutions provide a holistic approach to situational awareness and attack mitigation.

OUR MISSION

Our mission is to equip cybersecurity teams with first-in-class intelligence and technical solutions that continuously assess, monitor, and improve environments to mitigate ongoing or future attacks.

WHY US

As an agile and innovative company focused on cybersecurity, we pride ourselves on crafting highly tailored solutions to meet our clients' exact needs, not "one size fits all" products like our competitors in the domain.

With our combined experience in deep learning, AI, vulnerability research and big data, and partnerships with world-renowned subject matter experts, you can rest assured our solutions are built and run on information that is timely and accurate.
